Multivariate statistics is a subdivision of statistics encompassing the simultaneous observation and analysis of more than one outcome variable. The application of multivariate statistics is multivariate analysis..

Multivariate statistics concerns understanding the different aims and background of each of the different forms of multivariate analysis, and how they relate to each other.

Principal component analysis is a statistical technique that is used to analyze the interrelationships among a large number of variables and to explain these variables in terms of a smaller number of variables, called principal components, with a minimum loss of information. Our goal is to find a ...

We consider a random variable x and a data set $S = \{x_1, x_2, \dots, x_n\}$ of size n which contains possible values of x . The data set can represent either the population being studied or a sample drawn from the population. Looking at S as representing a distribution, the skewness of S is a measure of symmetry while kurtosis is a measure of peakedness of the data in S .

1. Introduction. Detecting outliers is a growing concern in psychology (Leys et al., 2013, Meade and Craig, 2012, Simmons et al., 2011). Indeed, Simmons et al. (2011) showed how significant results could easily turn out to be false positives if outliers are dealt with only flexibly and post-hoc. Leys et al. (2013) showed that researchers took insufficient care to detect outliers, using either ...
